

CSF Unit Project

Vision: Control everything around you to fulfill your desires

Objective: Control Style Feeling (CSF).

Mission: Innovating products in the field of artificial intelligence technology in the home, office and the street, serving women, children and those with special needs.

The idea: We are moving forward to transform all of our surroundings into digital systems, Capable of intelligent sensing for all needs and desires and implemented without the direct intervention of the human.

Idea details: There are about 40 ideas (products) in the first stage related to the operating system (CSF). The properties of the related products can be controlled and developed in the laboratory.

The main motivation for developing the idea:

Technology has great mysterious potential that can be harnessed to humanity. It has made me a catalyst for innovation. With my full faith in human abilities and making life easier and more disciplined in the digital world.

Problem and Solution:

In light of the escalating problem of energy consumption and lack of response to calls for rationalization. The idea of the project to provide a model capable of rational consumption of electricity, water and gas without any impact on human life. Also will be a main supporter in providing protection and safety services for women, children, elderly and people with special needs.

Distinguished Product & Service

CSF Lab will develop products to sell in the market until they reach the user and then enter the customer list to provide associated services.

How will customers reach?

Products can be marketed simply by international and local exhibitions for enterprises and companies, and as they serve the public class. as well customers be the main supporting in marketing after the experience of the effectiveness of the product and its importance in providing the best service. Moreover, by marketing campaign.

How will the money be generated?

I think the products will simply attract many members of the community in this world and will be the basic revenue through the sales then the fixed revenues through maintenance and follow-up services and subscription systems.

What are the important things we need to succeed?

The success path begins with one step and the path to success is to provide you with sketch of (Electrical Diagram Symbols) which will be the main source of the stage of manufacturing and processing the product and then the testing stage before starting to market.

We will need for more detailed information about the products available to you so that we can integrant them either as a primary or secondary product to build an integrated system commensurate with the need of the market.

Current impediments:

- Inability to manufacture the product after building the electronic chip.
- Lack of experience in this field because there are no integrated systems in our region.
